

**Damballa introduces two new protection products for enterprise clients in the fight against bots.**

Atlanta-Sept 25, 2007. Internet security company Damballa, Inc. has introduced two new protection products to help enterprise organizations defend themselves from bots and BotArmies. Damballa, the front line against the BotArmy threat, created these solutions to help enterprise organizations respond more rapidly to the growing number of BotArmies on the Internet.

**Damballa Enterprise Protection** identifies and isolates communications between compromised systems inside the network perimeter and BotArmy command-and-control centers on the Internet. **Damballa Extended Enterprise Protection** resides outside the network perimeter to prevent BotMasters from communicating with bots on internal systems and to intercept improper attempts to connect to trusted, mission-critical servers and applications.

Both offerings work in conjunction with Damballa's **Global Surveillance Network** to provide immediate identification and feedback on bots, BotMasters and BotArmy activity.

According to Bill Guerry, Damballa's VP of Product Management, "Our primary goal is to provide the best possible protection measures for our clients. With over 11% of the Internet already compromised by bots, we believe that these products will give our customers a significant edge in the battle against bots".

Damballa's enterprise solutions provide critical information that protects enterprise networks from BotArmies. Designed for the Global 1000, this real-time insight into internal and external bot activity allows enterprises to identify and quarantine bot activity within minutes of an actual compromise. In addition, Damballa's rapid, accurate threat recognition drives faster, more targeted remediation for BotArmy compromises anywhere within or across an enterprise network.

With Damballa, enterprise security staff has:

- Targeted, accurate international bot information – with virtually no false positives or guesswork.
- Real-time intelligence on BotArmy activities – both inside and across corporate boundaries.
- Actionable information on bot-compromised systems for rapid prioritization

- and remediation.
- 24x7 access to the Damballa BotArmy Knowledgebase for additional detail.

Damballa Enterprise Protection and Damballa Extended Enterprise are both available immediately. For more information about these solutions please contact [sales@damballa.com](mailto:sales@damballa.com).

**About Damballa, Inc.**

Damballa monitors the Internet fabric to pinpoint BotArmy formation and rallying activity. Born out of pioneering research from the Georgia Tech Information Security Center, Damballa is the most effective means of directly addressing the bot compromise dilemma. Damballa's approach focuses on BotArmy communications and rallying behavior. Traditional security products are signature-based and LAN focused and thus are ineffective against BotArmies that continuously morph their own code and distribute their activities across multiple LANs. It is the constancy of the command- and-control systems that transforms a collection of compromised hosts into a BotArmy. Damballa provides unrivalled security to Global 1000 clients and OEM partners by delivering actionable, real-time intelligence to address the BotArmy threat.
